forxiga®
(dapagliflozin)

# What is the problem?

Not knowing the risks of taking medications you feel that you need for your health carries the risk of:

- severe health complications

  common ones include internal bleeding and strokes from blood thinners, hypoglycemia and comas from insulin and diabetes medications, and acute liver failure from Acetaminophen/Tylenol overdoses.

- high financial costs

  of up to hundreds of billions of dollars nationally, or tens of thousands per family.

- hospital visits

  Medication related problems make up 10% of all hospital visits and 30% for older adults.

# Who does this affect?

This problem affects everyone, but there are a few groups that are especially vulnerable:

- Older Adults
- Individuals with Low Health Literacy (nearly 50% of patients do not take their medications correctly, often due to complex medical vocabulary and low health literacy - World Health Organization (WHO))
- Non-Native Language Speakers
- Family Caregivers
- Pharmacists and Doctors

# What are possible solutions to this problem?

Some solutions are possible, but most include downsides:

- Mandatory Pharmacist Consultations

This causes drastic increases in wait times in pharmacies, risks overworking the staff, and can raise privacy concerns.

- Simplified Medical Labels

This solution would often involve removing more specific or less common side effects, which would only cause more problems to arise.

# My Solution

- **The Idea:** The app would be designed to eliminate confusion in patients and the problems mentioned in previous slides.

- **The Design:** The app would feature a easy to use design in simple English that can be translated to other languages to avoid miscommunication.

- **How it Solves the Problem:** Using the app would require no medical knowledge from the user, avoids using advanced words people who lack strong medical literacy may not understand, and does not violate the privacy of the user.

# What information does the app use?

In order to use the app, the user would first input things such as:

- **Physical Health Information:** age, height, weight, etc.
- **Previous Health Information:** previously taken medications, medical history.
- **Current Health Information:** medications the user is currently taking, other information.

# Thank you!
